DESIGNING OF MANUFACTURING PROCESSES ON THE BASIS OF USE SADT - DIAGRAMMES

It is shown, that the technology of the automated designing of control systems of dynamic objects on the basis of use of SADT-diagrammes consists in accomplishing of sequence of stages: the analysis of a class of commitments subject to the decision, developments of program modules, modelling of dynamic object, calculation of concrete parameters of model, the analysis of results of modelling, decision-making on applicability of the developed system.

TRANSFORMATION OF MATHEMATICAL MODEL OF ASSEMBLY PRODUCT IN A LIMITED NUMBER OF ASSEMBLY SEQUENCES

This article describes a whole process of transformation of binary relations between parts of assembly product based on its 3D model into a full scheme of assembly. The method consists in transformation of disassembly scheme into a set of assembly sequences which are further restricted by manufacturing peculiarities. After having several assembly sequences a final decision as for the most optimal assembly sequence is taken by an expert considering manufacturing restrictions and working experience.

MINIMIZATION OF CAPACITY OF THE MATERIAL FLOW BY MEANS OF RATIONAL ARRANGEMENT OF TECHNOLOGICAL MODULES ON THE PRODUCTION SECTION

There is a description of the question of a decrease in costs for transportation of products in machine-assembling production in this article. This decrease is based on the procedure, which is offered by the author and is founded on optimization of material flows on a production section due to a rational arrangement of the technological modules on it. The developed procedure of construction of schemes of an arrangement of the manufacturing equipment on production sections can be used not only at designing of cell-type systems, but also at their operation due to rearrangement machines under conditions of changing of listed products, providing thus a planning flexibility of production.

MODUŁOWA STRUKTURA MINIATUROWEGO TRIPODA LABORATORYJNEGO**MODULAR STRUCTURE OF MINIATURE LABORATORY TRIPOD**

The article presents structure of precise parallel tri-axle manipulator with functionality of moving-inclinating table. End effector of the device is a platform, for which three coordinates of position are defined. The concept of the positioning mechanism is based on parallel tripod kinematics where end effector – the platform – is seated on three active limbs – actuators. The use of parallel kinematics allowed modular construction of positioning mechanism. The developed modular functional mechanism with minimal number of elements in kinematic chain ensures high positioning resolution. The concept of application of eccentric mechanism for platform positioning is an original idea in this solution.

MODUŁOWY MANIPULATOR DO POMIARÓW AKUSTYCZNYCH W KOMORZE BEZECHOWEJ**MODULAR MANIPULATOR FOR ACOUSTICAL MEASUREMENTS IN ANECHOIC CHAMBER**

The article presents modular structure of special manipulator for acoustical research in anechoic chamber. Presented modular solution allows automatic measurement with minimal interference in acoustical field. Manipulator allows automatic positioning of measurement microphone on the hemisphere. The manipulator consists of three modules: rotating platform module with vertical axis to manipulate the object under test, planar XY scanning module to manipulate measurement device and support and suspension module for the XY scanning module. Composition of platform rotation and planar movement of XY scanning modules creates measurement space in the shape of hemisphere. Geometrical dimensions of modules allow research in measurement hemisphere of maximum radius of 2000 mm.

MODUŁ KOMPENSACYJNY PODATNY W ZESPOLACH WCISKAJĄCYCH

COMPENSATORY FLEXIBLE MODULUS IN PRESSING UNITS

COMPENSATORY FLEXIBLE MODULUS IN PRESSING UNITS

Frequency controlled AC electric drivers with mechanical gears (angular or ball screws) are often used in assembling installations in which the process of joining items or units takes place by pressing. In the assembling technology by pressing the efficiency (it means the potential to perform the pressing at great speed) is as significant as the joining quality (accuracy and load capacity). The high accuracy of the joint is to be obtained by means of hard end stop pressing but because of this process the electric driver are subjected to great loads due to the sudden increase of unfavourable pressing forces. Therefore the use of force protective, compensatory flexible unit has been implicated, which would secure the driver while the hard and stop pressing is carried out. The paper presents the design of such modulus and results of investigations and tests an force hard end stop rise at the speed of 30 mm/s controlled by PLC.

Wojskowa Akademia Techniczna, Warszawa, Polska

TRWAŁOŚĆ ZMĘCZENIOWA POŁĄCZEŃ NITOWYCH

THE FATIGUE LIFE OF RIVETED JOINTS

The strength and fatigue life of riveted, hybrid (riveted-adhesive) and riveted joints reinforced composite patch have been investigated. Fatigue life riveted joints reinforced composite's patch, where using different epoxy materials – Epidian 53/Z1 and Epidian 57/Z1 was estimated. The results of experimental investigation of failure riveted joints and repair riveted joints were compared. The best results were received for joints where it was used lower elastic modulus adhesive (to forming composite patch). In the experimental investigation were obtained fatigue life of repair joints equal non-failure joints. The proposed in the work method of repairing of damaged riveted joints seems effective and it can make the alternative for repairs consisting in using metallic patch.
